Introduction

Your doctor has recommended that you have a flexible sigmoidoscopy. However, it is your decision whether or not to go ahead with the test. This leaflet gives you information about the test, its benefits and risks. It is to help you make an informed decision. If you have any questions after reading this leaflet, you will be able to ask them at your appointment.

This leaflet can be made available on request in alternative formats and in other languages to meet the needs of those who are not fluent in English.

What is a flexible sigmoidoscopy?

A flexible sigmoidoscopy is a look at the lower part of your colon (lower bowel). It is done by an Endoscopist.

We use an endoscope which is a long flexible tube about the thickness of your index finger with a small camera and light at the end. It is passed up your back passage (your bottom) into your colon. This allows us to get a clear view of the lining of your colon and to check whether or not any disease is there.

During your flexible sigmoidoscopy, we may need to take some tissue samples (called biopsies) to give us more information about your colon.
Why do I need a flexible sigmoidoscopy?

You have been advised to have a flexible sigmoidoscopy as you have symptoms which we think are coming from your lower colon.

A flexible sigmoidoscopy is a good way of finding out if there is a problem or not. It may also help ensure any treatment you are offered is as effective as possible.

What happens during a flexible sigmoidoscopy?

We may offer you a sedative to help you relax, although this is very rarely needed.

We gently pass the endoscope into your back passage and into your colon. We look at the lining of your colon on a screen. CO\textsubscript{2} or air is passed through the endoscope to give a clear view. This may cause you some discomfort but will not last long. You may also feel like you need to go to the toilet or to pass wind. This is normal. There is no need to be embarrassed as we expect it to happen.

We monitor your breathing, pulse and blood pressure throughout.

If we take tissue samples (biopsies), these will be sent to the laboratory for testing.

Also, if we find polyps, we may be able to remove them. Polyps are small lumps of tissue which hang from the inside lining of the colon. Removing polyps (called polypectomy) is done by an instrument that is attached to the endoscope. The polyps would also be sent to the laboratory for testing.

Large polyps may not be removed. You may be offered a separate appointment to have any large polyp removed.

At the end of the procedure the endoscope is gently removed.

The examination itself usually takes between 10 - 15 minutes. You should however allow at least 2 hours for the whole appointment – to prepare, for the test itself and to recover.
Before you leave, we will explain your results and what happens next. We will send similar information to your G.P. / Consultant.

**Are there any side-effects or possible complications (risks)?**

Most flexible sigmoidoscopies are done without any problem. The benefit from this test needs to be weighed up against the small risk of complications.

Occasionally, the endoscope may damage the colon. You would need to be admitted to hospital for treatment if this happens.

Heavy bleeding happens in around 1 in 150 patients who have polyps removed. If you don’t have the polyps removed, this is less likely (1 in over 400 patients). If you are taking medication to thin your blood, you should tell us (see next page).

Perforation (making a hole in the colon) can happen but it is extremely rare.

In extremely rare cases, flexible sigmoidoscopy can cause death.

If you have a sedative, you may feel tired or sleepy for several hours.

Risks from sedation are different for each person and they depend on the type of drug that is used. Serious complications are rare. The sedative can affect your breathing making it slower, more shallow and possibly stopping it altogether. The sedative may occasionally cause problems with blood pressure. Some people have an allergic reaction although this is very rare. We can usually identify and treat any such problems quickly if they occur.

If you are worried about possible risks, ask at your appointment.

In some cases, we are unable to complete the test and may need to ask you to have another one or to have a different test.

**Is there an alternative?**

Yes. An alternative would be to have a scan called a CT
colonography. If we find polyps you would still need to have a flexible sigmoidoscopy or colonoscopy (to look at all of your lower bowel) to remove them. Your Consultant / Endoscopist can discuss this with you if you wish.

I have decided to proceed with a flexible sigmoidoscopy? How do I prepare?

It is important to read and follow these instructions carefully.

Your colon needs to be empty so that we can get a clear view.

We will give you bowel preparation or an enema to clear out your lower bowel. Bowel preparation is a drink which makes you empty your bowel. It will make you have diarrhoea. An enema is given in the procedure unit prior to the test.

We recommend that you ask a friend / relative to accompany you to the hospital for your test.

If you have been asked to take bowel preparation you must follow the instructions so we can carry out your test.

If you are having sedation, arrange for somebody to take you home and stay with you overnight.

If you normally take heart, blood pressure or epilepsy medication, please take it as usual.
If you are on iron tablets, Fybogel /Regulan, stop taking them 7 days before your appointment.

If you are diabetic or are taking blood thinning medication, this would have been discussed with you if you have had a pre-assessment at the time of clinic visit.

Bring a list of your medications and dosages with you.

You may wish to bring a dressing gown and slippers. Leave all valuables at home.
What happens when I arrive?

You will be met by a nurse who will ask you some questions. If you are having a sedative, the nurse will ask about your arrangements for getting home. You will be able to ask questions if you have any. The nurse will make sure that you understand the flexible sigmoidoscopy.

You will have a brief medical assessment. The nurse will take and record your heart rate and blood pressure. If you are diabetic the nurse will take and record your blood glucose level.

You will be seen by the Endoscopist for a quick update of your symptoms. If you are happy to proceed with the flexible sigmoidoscopy, you will be asked to sign your consent form if you have not already done so.

This unit is a training centre for endoscopy. This means that trainees (supervised by qualified staff) may be involved in your care. If you do not want trainees to carry out your flexible sigmoidoscopy or be present, please inform us when you arrive.

Please ask us if you would like information about how we use and store tissue samples and hospital records (including images).

Delays to your appointment

We also deal with emergencies. These can take priority over your appointment, meaning we may have to ask you to wait or to change your appointment to another day.

What happens after the flexible sigmoidoscopy?

You will be allowed to rest in the hospital for as long as you need.

If you have not had a sedative, you will be able to go home.
straight after the test if you wish.

After you leave the hospital, you should rest for the remainder of the day and limit your activities until 24 hours has passed since your flexible sigmoidoscopy. Ask us for advice if you need it.

If you have had sedation you must have someone to stay with you overnight as you will still be drowsy with the sedative. This drowsiness can ‘come and go’.

This drowsiness means you must not:

- Drive a car (or any motorised transport) or ride a bicycle
- Operate machinery or electrical items
- Drink alcohol or smoke
- Take sleeping tablets
- Sign any legally binding documents or make any important decisions
- Work at heights (including climbing ladders or onto a chair)
- Lock the toilet door or make yourself unreachable to the person looking after you
- Look after children on your own

Most people feel back to normal after 24 hours.

**Entonox**

There is an alternative pain relief, Entonox (gas and air), to aid discomfort during the procedure. This can be discussed with the endoscopist on the day of your procedure.

**Aftercare**

After your flexible sigmoidoscopy, you may feel some discomfort from trapped air. This should settle down within a few hours. To help pass the wind, we suggest, if possible, that you walk around, drink warm drinks or peppermint water or that you eat some peppermints.

You can take pain relief, such as the kind you would take for a headache, as you normally would and according to their instructions.
You can start taking your normal medicines / tablets after your flexible sigmoidoscopy. Please ask if you are unsure if your medicines / tablets will be safe.

You can start eating normally again when you feel able.

Your bowel movements will probably be affected for a few days but they should return to normal after that. There is some important information on the right so you know what to do if you have any serious problems.

If any of the following happen within 48 hours after your flexible sigmoidoscopy, you need to seek help:

- Abdominal / tummy / chest pain that becomes more severe and is different or more intense than any pains that you would ‘usually’ have
- Breathing difficulties
- Fever (raised temperature)
- Passing a lot of blood from your bottom

If you have had any biopsies taken or polyps removed you could pass a small amount of blood from your bottom. This is normal.
If the bleeding becomes more severe or returns within two weeks of your flexible sigmoidoscopy, you need to seek help.
Contact us on the number provided between:
8am–6pm, Monday-Thursday
8am-2pm, Friday
Contact Ward C3, Antrim Area Hospital outside these hours.
Say that you have had a flexible sigmoidoscopy.
